

Compulsory Task 1 - Databases

1.
 - a. Data are raw facts that have not been processed yet to reveal their meaning. Unless organised in some logical manner, data is not that useful.
 - b. A field is a character or group of characters that have a specific meaning. It can be used to find or store data
 - c. A record is a logically connected set of one or more fields that describe a person, place or thing. It can be seen as a row in an excel spreadsheet.
 - d. A file is a collection of related records.
2. A DBMS is a program/set of programs that work to access, manipulate and control a database. The advantages of a DBMS are: improved data sharing, minimised data inconsistency, improved decision making, better data integration and improved data access.
3. Data are raw unprocessed facts and information is the result of data being processed. You cannot have reliable information without data.
4. Metadata is a set of data that describes and gives information about data. An example of metadata is a date time stamp on a photo that was taken on a camera.
5.
 - a. The file contains four records.
 - b. There are five fields per record.
